

Flavor analysis and research at the University of Minnesota

Jean-Paul Schirlé-Keller
jpsk@spectraflavor.com

Agenda

- ◆ Introduction
- ◆ Presentation of Research
- ◆ Questions

Flavor Laboratory

Professor Dr. Gary Reineccius

2 Research associates

1 Post-doctoral

9 graduate students

4 M.S.

5 Ph.D.

2 interns

2 technicians

Flavor laboratory (cont.)

- ◆ Diversity
 - ◆ People
 - ◆ Projects
- ◆ Strong ties to Industry
 - ◆ Short term issues: Off-flavor issues
 - ◆ Long term research (proprietary)

Research

- ◆ Diverse
 - ◆ Stability of flavor emulsions
 - ◆ Flavor performance as affected by process
 - ◆ Raw ingredients
 - ◆ Physical parameters
 - ◆ Cooking temperature
 - ◆ Storage (temperature, time)
 - ◆ Flavor release

Flavor analysis 101

FLAVOR EXTRACTION

- multitude of possible protocols, all biased
- single analysis rarely enough depending of goals
- probably the most under estimated portion

CHEMICAL ANALYSIS

- injection
- separation
- detection

INTERPRETATION

- identification
- quantification
- learnings

Current equipment

Current equipment (cont.)

- ◆ Gerstel TDS
- ◆ Gerstel CIS

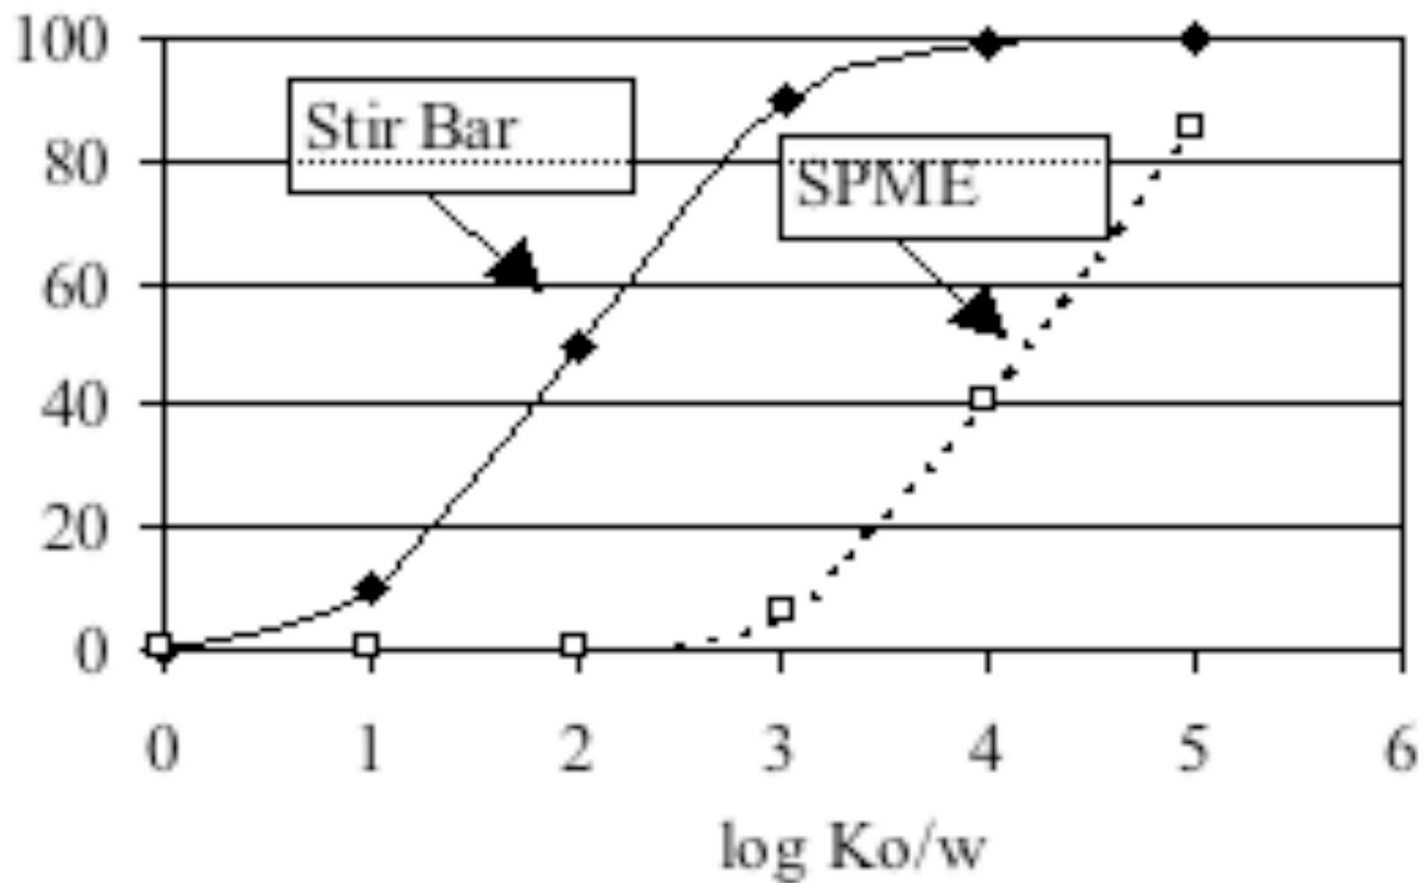

Twister

Method choice

- ◆ Dictated by:
 - ◆ Need for unbiased (i.e. fresh vs cooked)
 - ◆ Need for sensitivity (compared to static headspace)
 - ◆ Number of samples to analyze (>600 for the whole study)
 - ◆ Time available

Stir bar much more efficient than SPME

SPME work with MPS

Storage studies analysis

- ◆ Stability of flavor chemicals in a proprietary matrix under MAP conditions.
- ◆ Evolution of flavor profile of pasteurized flavored milk over shelflife

Stability of flavor chemicals under MAP

- ◆ 2 dozens of flavor compounds
 - ◆ Different chemical families
 - ◆ Different concentration
- ◆ Analyzed over 6 months as a function of:
 - ◆ time
 - ◆ Temperature
 - ◆ Chemical reactivity

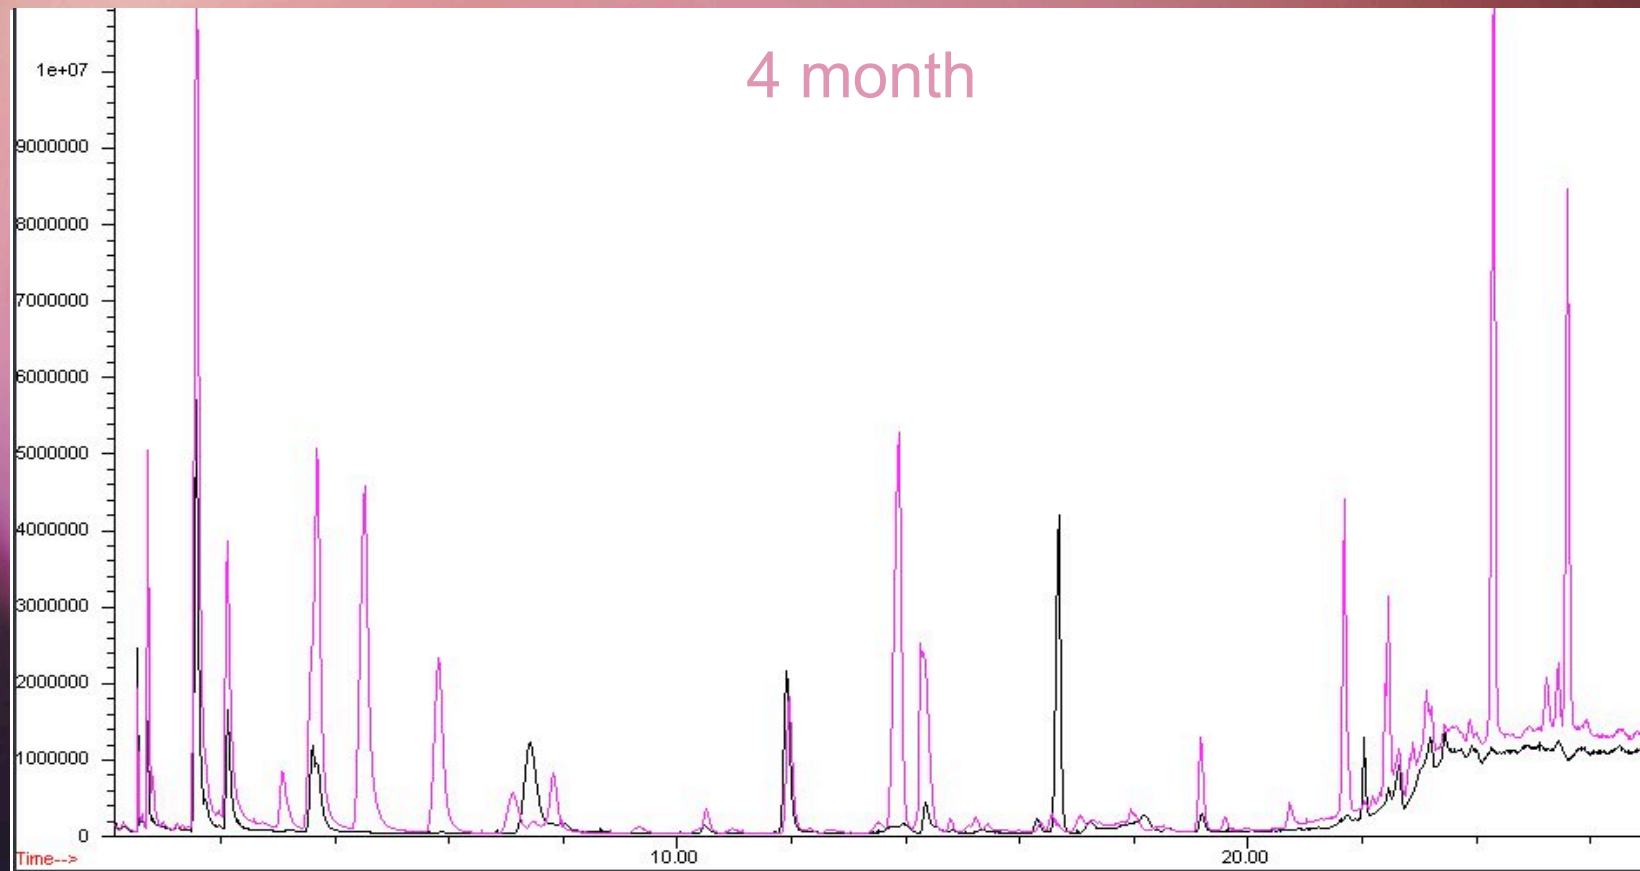

Stability of flavor chemicals under MAP (cont)

- ◆ Study set for 1200+ analyses not including
 - ◆ Standard curves
 - ◆ Development methodology
- ◆ Only doable with MPS

Stability of flavor chemicals under MAP (cont)

- ◆ Protocol
 - ◆ Sample (1 g in 20ml HS vial)
 - ◆ Equilibration 1 hr with PDMS/CAR/DVB at 50°C
 - ◆ Injection 5 min
 - ◆ Analysis in SIM
 - ◆ Duplicate analysis

Total ions chromatograms

Extended shelflife of flavored milk

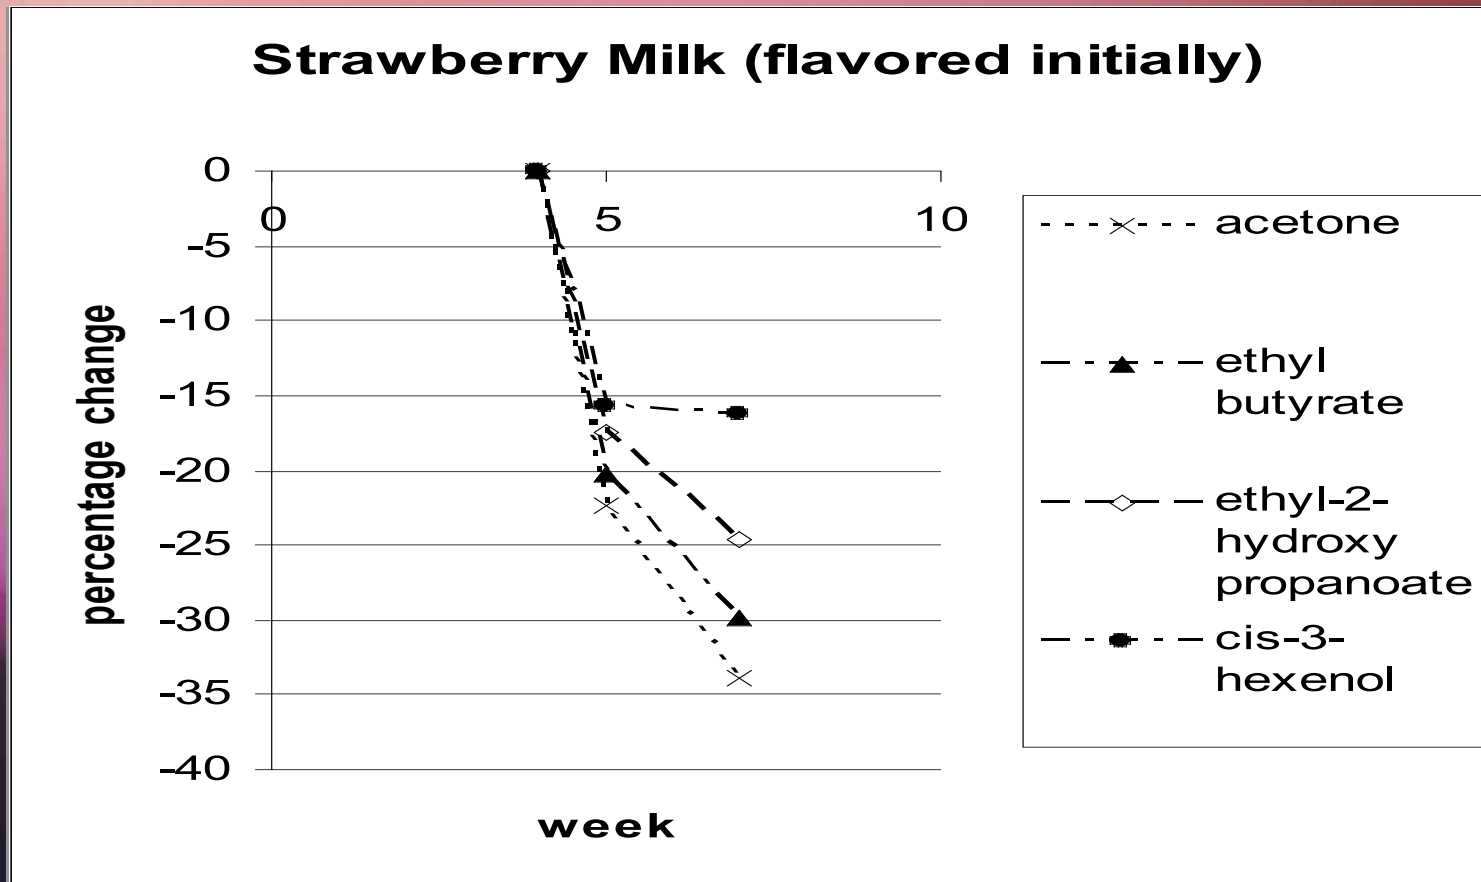

- ◆ Goal

 - Understand the shelflife of flavored milk
 - 4 different milks (including a control)

- ◆ Protocol (done in triplicate)

 - ◆ Equilibration of milk 45min at 45°C
 - ◆ Exposure of fiber (CARB/PDMS) 10min
 - ◆ Desorption 10 min at 250°C

Results - Strawberry Milk

Limitations of analytical method

- ◆ Review article from Nongonierma A. et al.
 - ◆ Competitive binding on fiber- quantification changes with other compounds adsorbed
 - ◆ Limited life of fiber (100 uses)
 - ◆ Fiber performance changes with time
 - ◆ Fibers vary in performance - (change fiber during study due to breakage)
- ◆ Implications
 - ◆ Data must be considered in terms of trends as opposed to individual data points
 - ◆ Not absolute values but relative values

Theoretical Recovery

$$\diamond \quad \frac{m_{\text{PDMS}}}{m_o} = \frac{k_{\text{PDMS}/w} / \hat{E}}{1 + k_{\text{PDMS}/w} / E}$$

◆ Where:

◆ m_{PDMS}/m_o = fraction of aroma compound isolated

◆ $k_{\text{PDMS}/w}$ = partition coefficient between fiber and food continuous phase

◆ m_o = total mass of analyte in food

◆ \hat{E} = phase ratio e.g. V aqueous phase / V extracting phase (PDMS)

Equation:

- ◆ Low Log P and low phase ratio characteristic of the method make isolation inefficient.
- ◆ E.g. SPME fiber generally has about 0.5 \bar{V}_1 of phase
- ◆ Solution: stir bar method

Twister

- ◆ Advantages
 - ◆ Increased phase material
 - ◆ Increased surface area
- ◆ Type of extract
 - ◆ Headspace
 - ◆ Direct

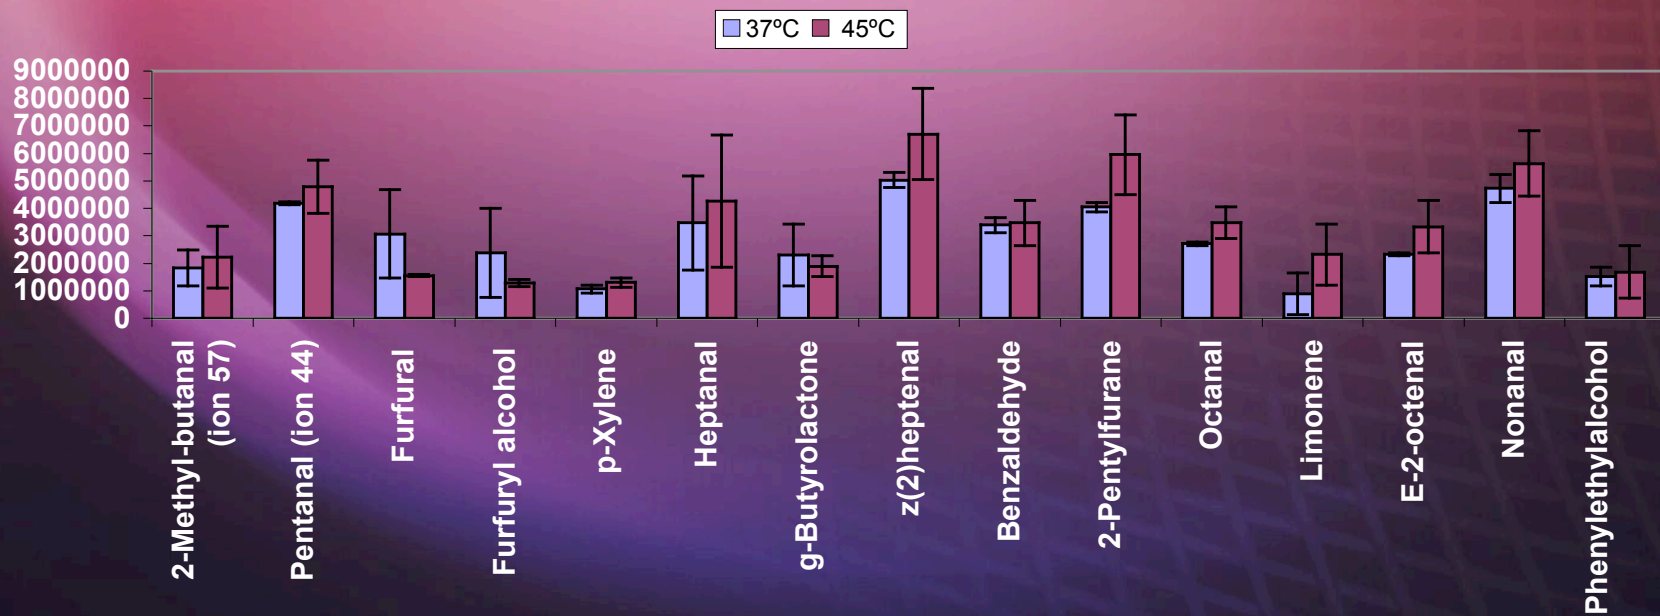

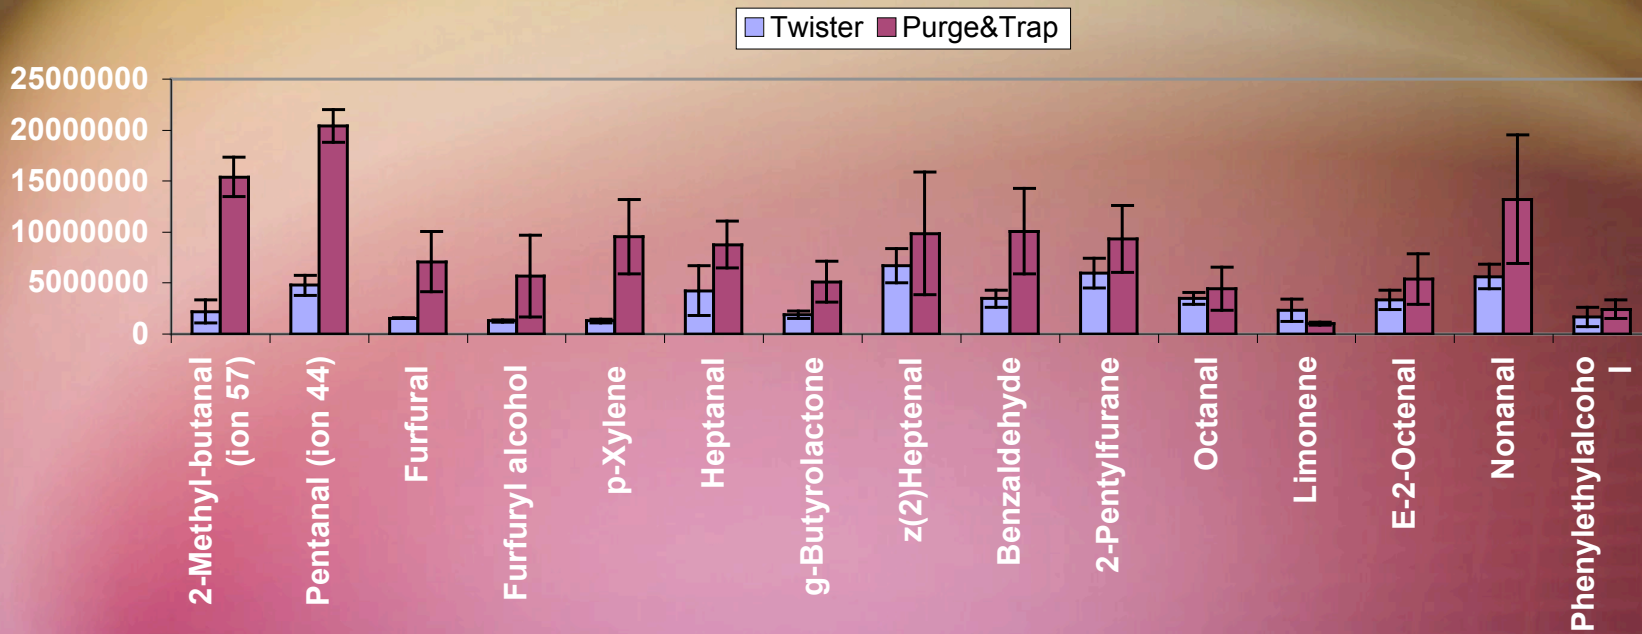

Current/recent projects

- ◆ Flavor volatiles from crackers
- ◆ Flavor volatiles from flavor solutions
 - ◆ reconstituted
 - ◆ diluted
- ◆ Flavor volatiles from vegetable sauces
- ◆ Flavor volatiles from plant material
- ◆ Flavor volatiles in wines
- ◆ Flavor volatiles in mouth

Flavor volatiles from baked goods

- ◆ Goal
 - ◆ Determine presence of compounds of interest
 - ◆ Compare different extraction techniques
- ◆ Protocol (done in triplicate)
 - 50g of crackers in a jar (whole or ground)
 - ◆ Twister:
 - ◆ Twister placed on top of a Teflon mesh
 - ◆ Equilibration 1hr at 30°C, 37°C, 45°C
 - ◆ Desorption splitless (+ cryofocusing) 5 min at 250°C
 - ◆ Purge and trap:
 - ◆ 30 min at 45°C, 40 ml / min
 - ◆ Desorption splitless (+ cryofocusing) 10 min at 250°C

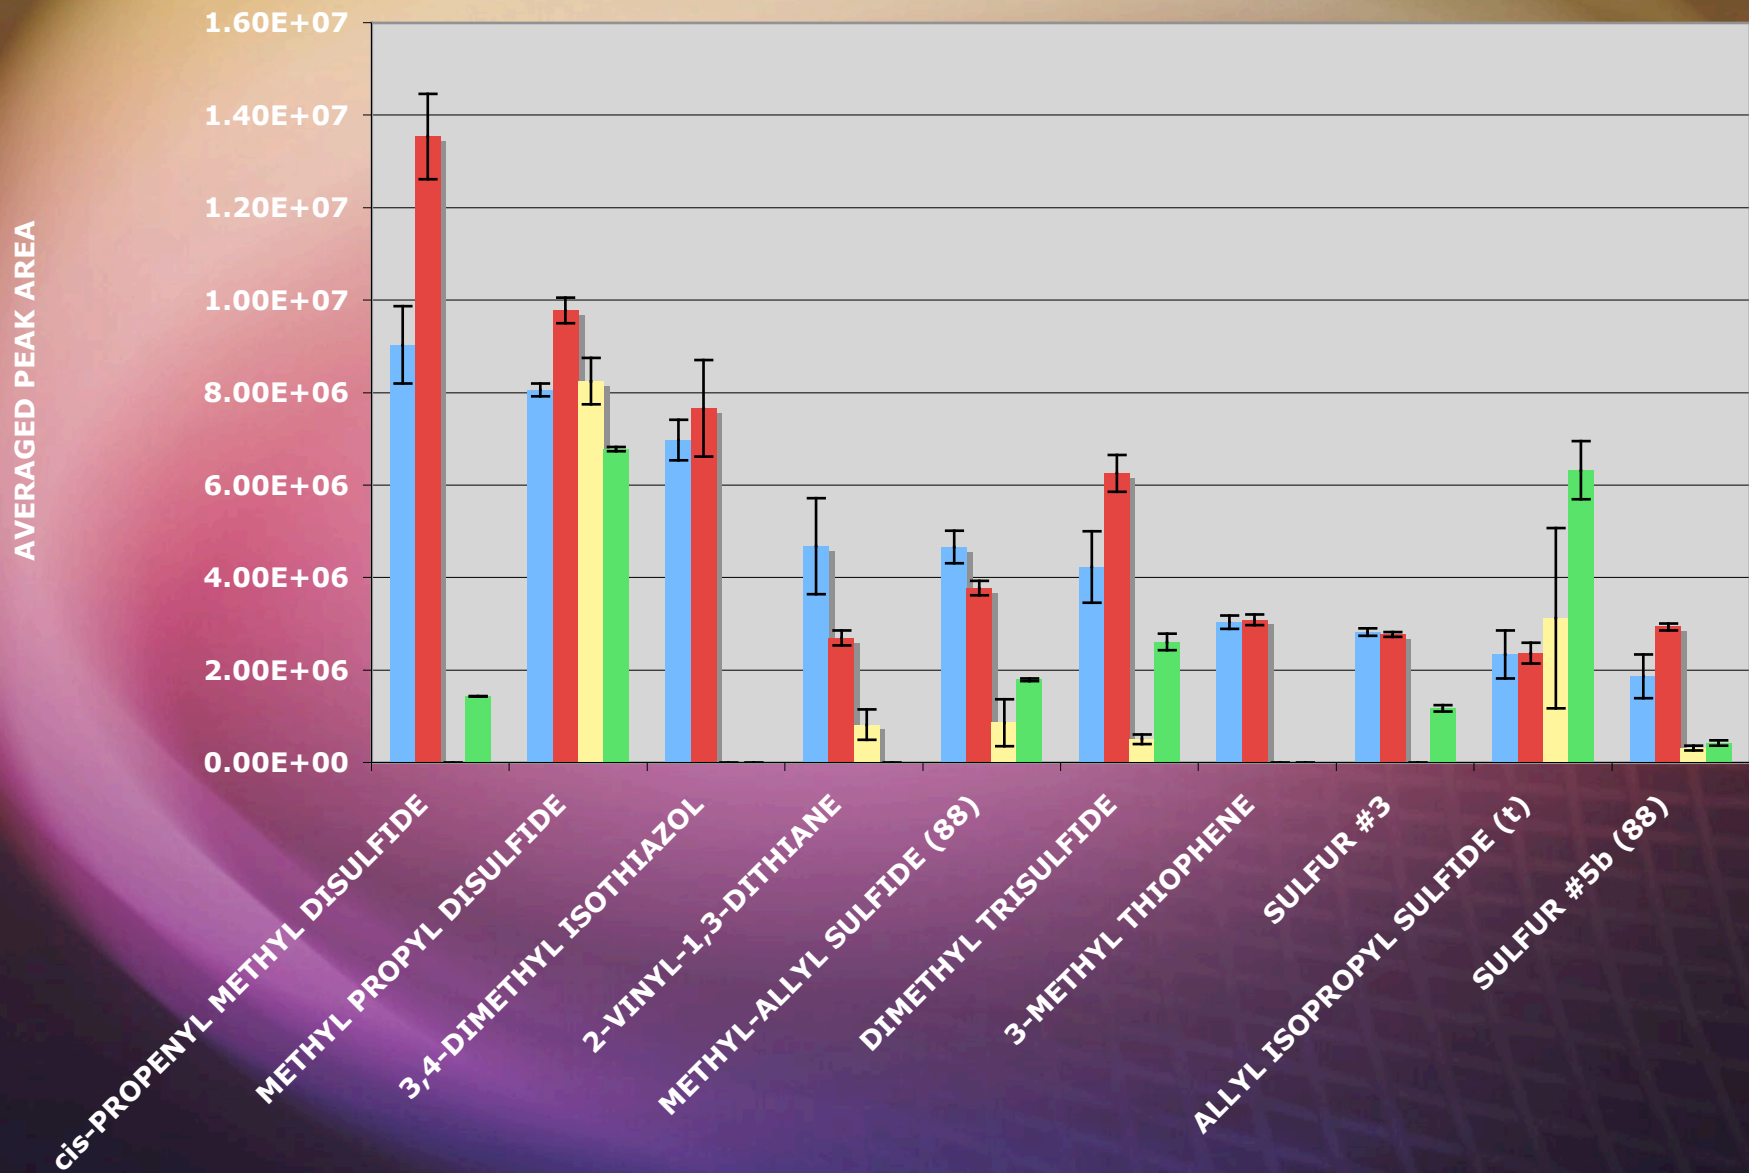

Flavor volatiles in flavor solutions

- ◆ Goal
 - ◆ Determine the difference in flavor compounds due to processing
- ◆ Protocol (done in duplicate)
 - 10 ml of reconstituted beverage
 - ◆ Twister: exposure 45min at RT, desorbed splitless (+ cryofocusing) 5min at 250°C
 - ◆ SPME-PDMS fiber (1 ml, 10min at RT), injection splitless at 250°C

Flavor volatiles in sauces

- ◆ Goal:
 - Determine the
 - ◆ Difference in flavor profile
 - ◆ Origins
- ◆ Protocol (done in triplicate)
 - ◆ 100g sauce placed in a jar
 - ◆ Twister placed over sauce on a Teflon mesh
 - ◆ Exposure 30 min at 37°C
 - ◆ Desorbed splitless (+ cryofocusing) 5 min at 250°C

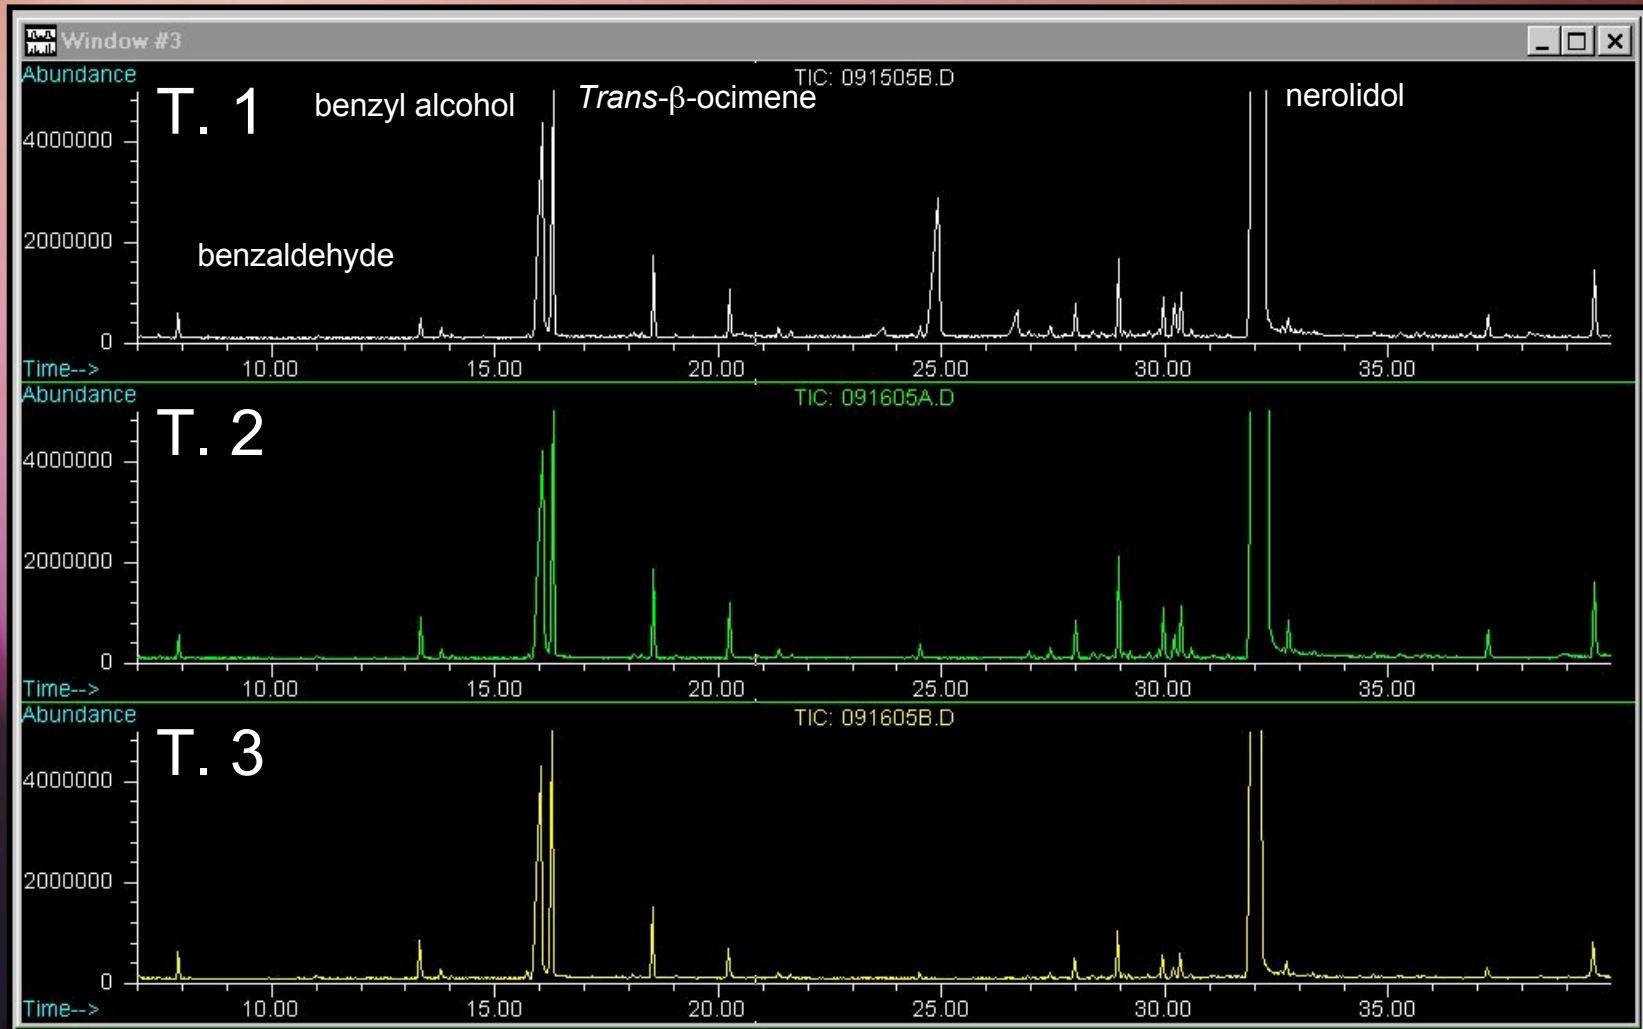

Flavor volatiles in plants

- ◆ Goal
 - determine volatile components of flowers
- ◆ Protocol
 - ◆ Twisters (10) placed in round bottom flask
 - ◆ Round bottom flask placed over bud before bloom
 - ◆ Twisters exposed 12 hrs at 15°C
 - ◆ Desorbed splitless (+ cryofocusing) 5 min at 250°C

Triplicates of flower extract

Flavor volatiles in wines

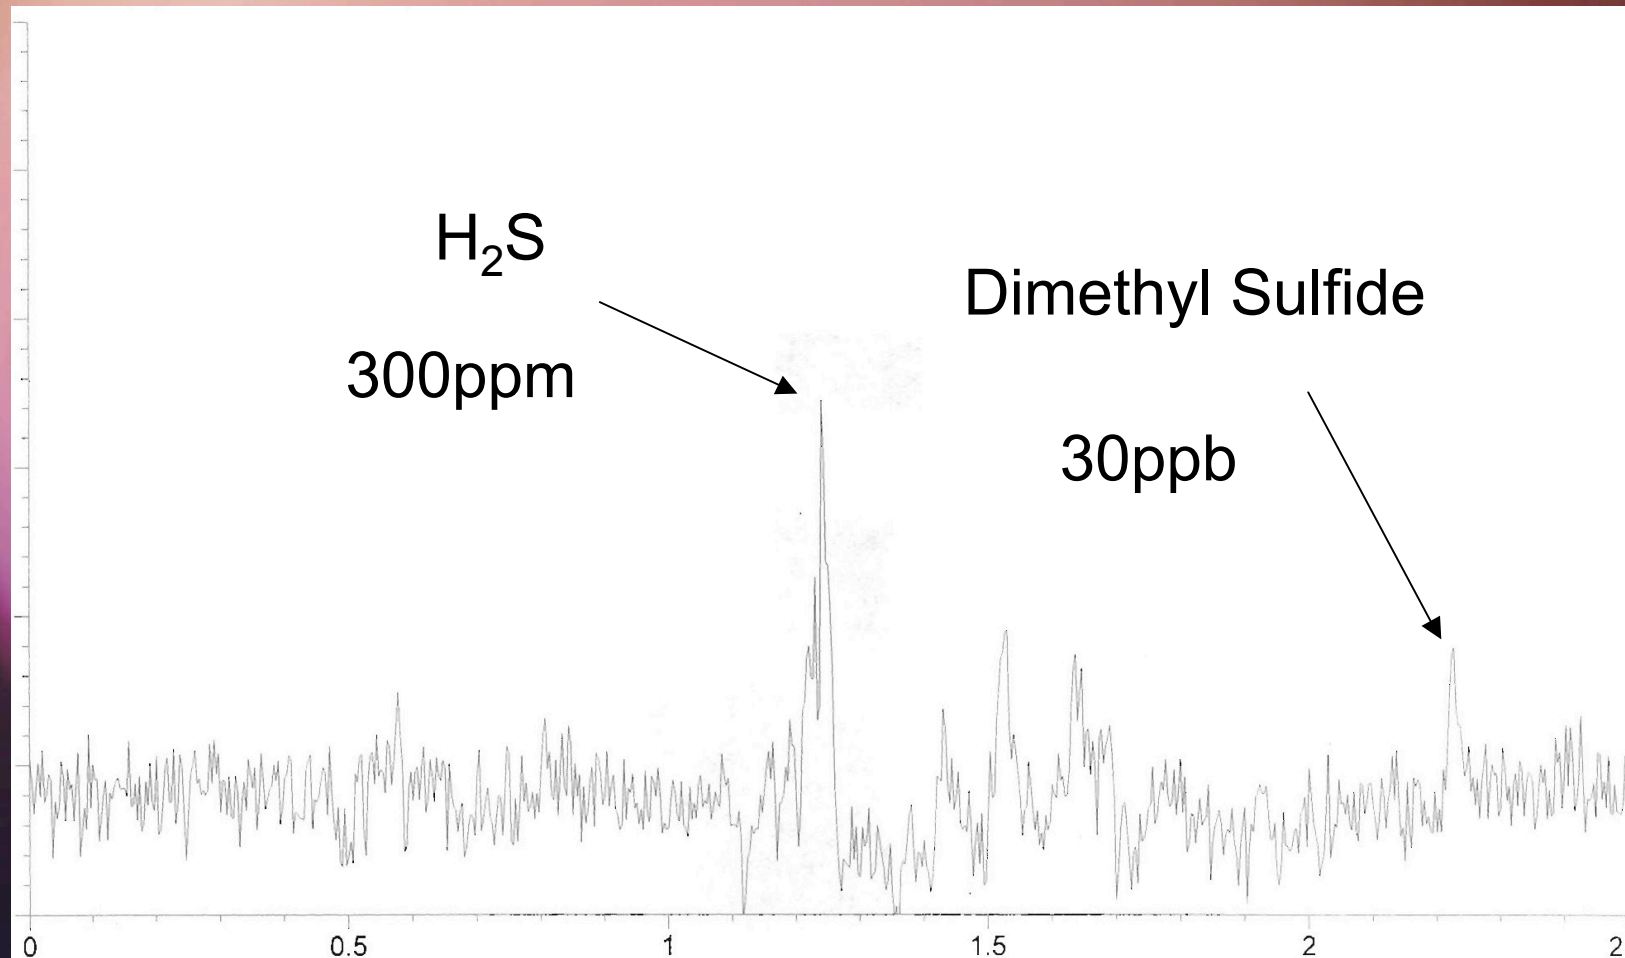

- ◆ Goal:
 - determine differences in flavor volatiles between wine and correlate to sensory profile, plant variety.
- ◆ Protocol:
 - ◆ Twister placed into 10 ml wine
 - ◆ Equilibrated for 1.5hr at room temperature
 - ◆ Desorbed splitless (+ cryofocusing) 10 min at 270°C

Flavor volatiles in mouth

- ◆ Goal
 - understand the effect of some particular mouthwash components on the decrease of sulfur compounds responsible for bad breath
- ◆ Protocol (in triplicate)
 - ◆ Twister placed in mouth for 5 mins
 - ◆ Dried (KimWhip)
 - ◆ desorbed in splitless (+ cryofocusing) 5 min at 190°C

Analysis of sulfur compounds

Summary

- ◆ Twister: big improvement
 - ◆ More phase, better sensitivity
 - ◆ Easier, more reproducible, more stable
- ◆ Limitations?
 - ◆ fat matrices
 - ◆ carry over
 - ◆ cryofocusing

Summary

- ◆ The Automatic
